

# **Attorney Management System**

## **Abstract**

The attorney management system is used to automate all the activities of the clients and their advocates. With the increase in number of cases, it becomes difficult for Lawyer/Law firm to manage and monitor the case details manually so the main aim of this system is to help in that case not only from the advocates view but from the view of client also.

Client, advocates, admin are the major three users of the system. The client is the one who seek judiciary help from an advocate. The advocate is the one who provides judiciary help for the needy. The admin is the one who verifies the advocate and the case of the client, the overall management of the system is done by the admin

The client need to register in the system in order to access the full functionalities after a successful registration the client can input his case details to the system and from a list of advocates he/she can choose an affordable one. The advocate can automate his full office work with the help of the system such as case management, hearing dates management, verdict management etc. The advocate can either accept or decline the request from the client.

Even in the age of Digital India, lawyers were hugely dependent on physical records. When the no of cases increases it becomes difficult to manage and monitor the case details manually. Mishandling of data can also occur in this case.

Attorney management system manages cases, legal matter, client relationships and teamwork. It empowers you or your team to be even more efficient, saves you a lot of time, and enhances team collaboration as well as client and advocate relationships. It can serve as a virtual office, allowing the advocates to allocate work, take notes, check hearing dates. The client can feel free to interact with the attorney.

To develop the system HTML, CSS, JAVASCRIPT, PYTHON DJANGO FRAMEWORK etc is used in the front-end and MY SQL is used as the back-end
